

Guide 6: Innovation Scoring Engine — Complete PRD

"Objective Idea Evaluation — No Guesswork"

Document:	Innovation Scoring Engine — Feature PRD v1.0
Feature:	Cross-Cutting — All Modes Use This
Date:	June 2026
Status:	Final — Ready for Development

1. Feature Overview

Innovation Scoring Engine har generated idea ya evolved version ko 4 dimensions mein objectively evaluate karta hai. Ye sirf random number nahi — weighted rubric hai with AI-powered justification. Har score ke peeche 1-sentence reasoning hoti hai. Visualized as D3.js radar chart.

Key Principle: Same idea, different user = different scores. Kyunki feasibility aur complexity match user ke constraints pe depend karta hai.

2. Scoring Dimensions & Weights

Dimension	Weight	Description	Criteria
Originality	30%	How unique vs existing solutions?	Novelty of concept, non-obviousness, creative combination
Technical Feasibility	25%	Can user build this with constraints?	Skill match, timeline fit, resource availability
Market Potential	25%	Is there real demand and monetization?	Target audience size, competition, revenue model
Complexity Match	20%	Does difficulty align with user profile?	Team size appropriateness, learning curve, risk

Overall Score Formula

$$\text{Overall} = (\text{Originality} \times 0.30) + (\text{Feasibility} \times 0.25) + (\text{Market Potential} \times 0.25) + (\text{Complexity Match} \times 0.20)$$

Verdict Categories: 90-100 = Exceptional, 80-89 = Strong, 70-79 = Good, 60-69 = Average, 50-59 = Weak, <50 = Reconsider

3. ScorerAgent Architecture

ScorerAgent ek objective evaluator hai. Low temperature (0.2) for consistency. Har dimension pe independently score karta hai with justification. User profile directly influence karta hai feasibility aur complexity match scores.

```
// ScorerAgent System Prompt You are an objective innovation evaluator with expertise in product strategy, technical architecture, and market analysis. Score the given idea on 4 dimensions. Input: - Idea: {idea_details} - User Profile: {user_profile} - Context: {mode} // GENERATOR, EVOLUTION, or ARCHAEOLOGY Scoring Rules: 1. ORIGINALITY (0-100): - 90+: Never seen before, groundbreaking concept - 70-89: Creative twist on existing idea - 50-69: Incremental improvement - <50: Copycat or obvious solution 2. TECHNICAL FEASIBILITY (0-100): - Consider user's skill level, budget, team size, timeline - 90+: User can build this in sleep - 70-89: Challenging but achievable - 50-69: Stretch goal, might need help - <50: Impossible given constraints 3. MARKET POTENTIAL (0-100): - 90+: Billion-dollar market, no competition - 70-89: Large market, some competition - 50-69: Niche market, crowded space - <50: No clear market 4. COMPLEXITY MATCH (0-100): - 90+: Perfect fit for user's timeline and team - 70-89: Slightly ambitious but doable - 50-69: Might need to cut features - <50: Way too complex For each score, provide: - value (0-100 integer) - justification (1 sentence, specific and objective) - confidence (0-1, how sure you are) Output: Strict JSON with all scores and overall.
```

4. Output Example

```
{ "scores": { "originality": { "value": 85, "justification": "Auto-matching with skill gap analysis is uncommon; most platforms use keyword search only", "confidence": 0.88 }, "feasibility": { "value": 78, "justification": "React + Node + OpenAI is within intermediate skills; 2-week timeline fits MVP scope", "confidence": 0.92 }, "marketPotential": { "value": 72, "justification": "Large student market exists, but LinkedIn and Indeed have strong competition", "confidence": 0.85 }, "complexityMatch": { "value": 80, "justification": "3-person team can handle MVP in 2 weeks; AI integration is manageable with OpenAI API", "confidence": 0.90 } }, "overallScore": 79, "overallVerdict": "GOOD", "recommendation": "Strong candidate with good feasibility. Consider differentiating from LinkedIn by focusing on college-specific features.", "comparisonToUserPast": { "similarPastIdea": "Job Finder Dashboard", "similarityScore": 0.65, "note": "This idea is more focused than your past project; consider evolving your existing idea instead" } }
```

5. Radar Chart Visualization (D3.js)

D3.js se interactive radar chart banata hai. 4 axes: Originality, Feasibility, Market Potential, Complexity Match. Area fill color score ke hisaab se: Green (80+) = high, Yellow (60-79) = medium, Red (<60) = low. Hover pe score aur justification dikhta hai. Compare mode: multiple ideas overlay kar sakte hain.

Animation: Score counter 0 se final value tak animate hota hai. Area gradually fill hoti hai. Ye 'wow' factor hai jo judges ko impress karega.

6. Personalization Impact on Scores

Same Idea: AI Resume Matcher

Beginner (\$0, solo, 2 weeks): Feasibility=95, Complexity=95, Originality=70, Market=65. Overall=82.
Reason: Simple keyword matching, no AI API, easy to build.

Same Idea: AI Resume Matcher

Advanced (\$5000, 5 people, 3 months): Feasibility=60, Complexity=55, Originality=90, Market=85.
Overall=73. Reason: Complex vector search, microservices, competitive but innovative.

7. Interview Talking Points

Why 4 Dimensions Instead of 1 Overall Score?

Single score misleading hota hai. Ek idea 95 originality lekin 30 feasibility — ye 'great idea but unbuildable' hai. 4 dimensions se user trade-offs samajh sakta hai. Radar chart se visual comparison easy hota hai.

How Do You Prevent AI Bias in Scoring?

Low temperature (0.2) for consistency. Structured rubric with specific criteria per range. Justification required for every score — ye 'gut feeling' ko eliminate karta hai. Confidence score batata hai ki AI kitna sure hai.

Why Personalized Scores?

Same idea beginner ke liye 'easy' hai, advanced ke liye 'boring'. Feasibility aur complexity match user ke hisaab se change hote hain. Ye 'one size fits all' approach ko reject karta hai.

What's the Business Value?

Users 'GOOD' ya 'STRONG' ideas pe focus karte hain. Weak ideas automatically filter ho jaate hain. Platform engagement badhta hai kyunki users confident hain apni choice pe.
